

As it is current practice irr standards published by the thearrationa/ Organization for Standardization (ISO), the comma has been used throughour as a decimal marker.

This standard contains the main specifications of $1504762-1977$, adopled in a modified form, with natiomat adklenda
These addenda are shaded grey in ciauses 1 and 3 to 6 .

Dimensions in mm

## 1 Field of application

This standard specifies product grade $A$ hexagon socket head cap screws with metric screw threads and thread diameters from 1.4 to $100 \mathrm{~mm}^{1}$ ). 1 ', in exceptional cases, the screws are to mect requirernents other than those given in this standard, these shail be setected in accordance with the appropriate standards.

## 2 Dimensions

Top head may be radiused or chamfered

Maximum underhead fillet

$$
\begin{aligned}
& f_{\text {max }}=1.7 r_{\text {max }} \\
& r_{\text {max }}=\frac{d_{\mathrm{amax}}-d_{\mathrm{s}} \max ^{21}}{2} \\
& r_{\operatorname{man}}
\end{aligned}
$$

${ }^{1}{ }^{1}$ In isO 4762, the range is $M 1.6$ to M 36.
2) In ISO 4762, this is given incorrectly as $r_{\text {max }}=\frac{d_{a}-d_{3}}{2}$; an application has been made to ISO co correct thic.

Tabla 1. (Continued)

The commercial nominal lengths are designated by giving the shank lengths $t_{s}$ and/or $t_{\mathrm{g}}$.
Thread sizes and intermediate lengths given in backets shall be avoided where possible.
Nominal lenguts above 300 mm shall be in 20 mm steps.
Screws with nominal longth above the dashed stepped tine are threaded to head (distance between the last full thread and the head bearing surface $t_{\mathrm{k}}$ max. $=3 \mathrm{P}$. Sicews with nominal tengths below the dashed stepped tine have $t_{k}$ and $t_{3}$ valuex in
 The values given for $I_{\text {, }}$ and $I_{k}$ enply to screws with coarse threads.

## 4 Designation

Destination of a hexapon socket head cap screw with $M 12$ screw thread, nominal fength $1=60$ mm and assigned to propenty clas 12.:; Yeragon socket head cap screw DIN $912-\mathrm{M} 12 \times 60-12.9$
DIN 962 shal apply with regard to the designation of types and cesigns with additlonal dats to be given when ordering. Q.a. type B with shank dlametar $\approx$ pitch diameter.

DIN: 6000 shall apply with repard to the designation of designs with captive componants (fcrew assemblies).
DIN 7500 applies with repard to the designation of designs with thread-forming properties.
The international designation for hexagon socket head cap screws in accordance with ISO 4762 (not the shaded data) is,
e.g.:

$$
\text { Hexegon socket head cap screw ISO } 4762-\mathrm{M} 12 \times 60-12.9
$$

At prosent, the ISO 4762 designatlon does not include an acceptance test in accordance with DIN 267 Part 5.
DIN 4000-2-1 tabular fayout of article characteristics shall apply to sor ews in accordance with this stendard.

## 5 Mass

The values of mass given are guidance values and are givan for the commercial lenigths.
Table 2.

| Thread size 1 | M 1.4 | M 1.6 | M 2 | M 2,5 | M 3 | M 4 |  | $\text { M } 6$ | M 8 | M 10 | M 12 | (M 14) | M 16 | (M 18) | M 20 |

| OIN 7500 | Thread forming screw for 150 metric screw threads |
| DIN ISO 898 Part 1 | Mechanical propercies of fasteners: bolts, screws and studs |
| OIN ISO 4759 Part I | Tolerances for fasteners; bolts. screws and muts with thread diameters $\geq 1.6$, $n d \leq 150 \mathrm{~mm}$ and product grades A. B and C |

## Previous editions

DIN 912 Part 1: 11.70 : DIN 912 Part 2: 10.69 ; DIN 912.10 .33 . 02.37. 04.46, 07.53. 03.61, 12.67, 09.79

## Amendments

Compared with the September 1979 edition, the following amendments have been made:
a) The content of the standard has been revised editorially.
b) The designation in accordance with ISO 4762 has been included.
c) The values for $d_{a}$ have been changed for sizes M 12, M 14 and M 16 .
d) The masses for sizes M 56 to $\mathrm{M} 100 \times 6$ have been corrected.
e) The $\mathrm{M} 18 \times 2$, M $20 \times 2$ and $\mathrm{M} 22 \times 2$ fine threads have been included.
f) The reference to the permissible product grade $F$ for sizes up to $M 2.5$ has been deleted.
g) For general requirements, reference has been made to DIN 257 Part 1 and for permissible surface defects to DIN 267 Part 19.
h) The position of the dashed stepped line for M 12. M 16. M 18, M 20, M 30. M 36. M 42, M 48 and M 56 has been changed.

## Explanatory notes

As can be seen from the amendment section. no major or misleading amendments have been made to this revised edition of OIN 912 compared with the previous September 1979 edition. A fein important points which have rosulted from adopting 1504762 in modified form are explained below to help understand the standard:
a) It was not possitile to adoot ISO 4762-1977 as national Standard DIN 1504762 and as a replacement for the November 1970 edition of DIN 912 Part 1 and the October 1969 edition of Part 2 in unmodified form, as ISO 4762 only covers parts of the scope of these standards ( M 1.6 to M 36 ) and does not specify any intermediate sizes. Also. ISO 4762 does not comtain some international reference standards which, untit they appear, have to be replaced by nationai standards. e.g. DIN 267 Part 5 for the acceprance test.
b) In order to include ISO 4762 in modified form in OIN G12. the so.called shading solution, which in the meantime has also been used for other standards on fasteners, has been adopied, i. e. all the national specifications deviating from or extending beyond ISO $4762-1977$ have been indicared by shading. Nothing has been deleted from ISO 4762.
c) Translator's note. Paragraph cl is only of relevance to the German original and has thus been omitted from this trans. lation.
d) In the 1979 edtion of OIN 912 , some of the previous thread lengths were increased to comply with 1504762 . After this edition was published, difficulties uf conversion resulted in some cases which have, however, been resolved in the meantime. As is well known, $b=2 d+12$ mm applies unitormly for calculating the thread lengths.

## Page 12 DIN 912

e) Detailed dimensions have been given for the head bearing surface and maximum underhead fillet. As before, doubis still exist about the value specified in ISO $4762-1977$ for the bearing surface diameter $d_{w}$ min. Values corresponding $10 d_{\mathrm{w}} \mathrm{min} .=d_{\mathrm{k}} \mathrm{min}-\mathrm{IT} 15$ are more suitable in practice from the cold forming point of view. Discussions are being held on an international basis about a corresponding revision of ISO 4762 and ISO 4759/1 (see DIN ISO 4759 Part if,
When calculating the surfang When calculating the surface pressures, it is recommended using the following proposed values in the range M 3 to M 24 .

|  | Thread size $d$ | M 3 | M 4 | M 5 | M 6 | M 8 | M 10 | M 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{d}_{w}$ | ISO 4762 IDIN 9121 | 5.07 | 6.53 | 8.03 | 9.38 | 12.33 | 15.33 | 17.23 |
|  | (Proposal) | 4.84 | 6.20 | 7.70 | 9.20 | 12.03 | 15.03 | 17.03 |

| Thread size $d$ |  | M 14 | M 16 | M 18 | M 20 | M 22 | M 24 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 SO 4762 (DIN 912) | 20.17 | 23.17 |  |  |  |  |
|  | (Proposal) | 19.83 | 22.83 | 25.87 | 28,87 | 31.81 | 34.81 |
|  |  |  | 22,83 | 25.83 | 28,83 | 31.61 | 34.61 |

1) The previous depths of the hexagon sockets have been reduced in line with ISO 4762 for reasons of head strength and a resulting minimum base thickness $w$ given. The tolerances for the widths across flats have been narrowed somewhat. A second type for the hexagon socket (prebored and finished) has been included.
g) The limiting values of the individual dimensions have been included. They have been calculated in accordance with DIN ISO 4759 Part 1 (supersedes parts of DIN 267 Part 2).
h) Instead of the previous "design m ". product grade A has been given in line with DIN ISO 4759 Part 1 without any major changes to the tolerances resulting.
i) The masses of hexagon socket head cap screws not included in i50 4762-1977 have been listed in a separate table. As before, because of the tolerances on dimensions, these are approximate values.
k) As a supplement to iSO 4762-1977, fine threads have been included in line with the selection deseribed in DIN 13 for screws (ISO 262), but thes M $10 \times 1$ and M $12 \times 1,5$ not included in the international selection of thread sizes
I) The October 1969 edition of DiN required nationally. Efforts are being made to have ISO 262 revised. sizes up to M 2,5. However, this product grade is specified product grade $F$ in accordance with DiN 267 Part 6 for Therefore, it has been deleted.
m ) The technical delivery conditions have been supplemented with references to the corresponding basic standards.
m) The contents of the standard have been aligned editorially with ISO 4762-1977. 150 4762-1977 contains some printing errors. These have been corrected in this standard. Corresponding corrections are planned for the ISO Standard.

## International Patent Classification <br> F 16 日 23/00

[^0]:    For hexagon socket head cap screws with fine threads, approximately the same masses mav be assumed.
